

# SW150 Circular Polariser

The 150mm Circular Polariser can only be used in one orientation. Please ensure that the printed face is away from the lens, facing the subject.

If used alone, the polariser can be placed into the filter holder and the holder rotated until the desired effect is achieved.

If used with a grad filter, the grad should be positioned first, then the polariser added – you will have no rotation possible without turning the grad, but will have a choice of two axis of polarisation, achievable by turning the filter through 90 degrees.
